

RPM Assure

How the application works · How SLA is calculated

17 August 2026 · SYSPRO Support & AMS Rev 5.0 · Industry measures 14 Aug 2026

1. What RPM Assure is

One boardroom view of every customer we manage. It pulls live data from **SYSPRO**, **Pulseway** (remote management), **Cove** (cloud backup), **Bitdefender** (endpoint protection) and **Microsoft 365**.

It does **not** replace those products. It answers three questions: **who is in cover**, **is the service healthy now**, and **are we meeting SLA**.

2. How to read the screen

Lamp	Meaning
Cover / No Cover	In scope for that customer (contract / mapping). No Cover is not scored and never inflates a percentage.
Robot — Green / Amber / Red	Live health of that service <i>right now</i> .
SLA %	Measured performance vs target, only on covered services .

Colour bands (used everywhere): Green ≥ 80 Amber 55–79 Red ≤ 54

A tenant is only **Red** if a **covered** service is Red. Microsoft 365 is **posture only** — it never moves SLA or tenant RAG.

3. The five services

Service	What EXCO sees	Source
SYSPRO EcoSystem	Collect freshness, job errors, FinSight out-of-balance, licence, operators	Customer SQL + Assure agent
RPM Remote Management	Servers online, 30-day uptime, critical alerts, patches	Pulseway
RPM Cloud Backup	Backup success, 24-hour RPO, restore tests	Cove
RPM EPP	Endpoints managed, signatures current, open high/critical incidents	Bitdefender
Microsoft 365 CSP	Secure Score, MFA, admins — not in SLA	Microsoft Graph

Customer Ecosystem (top of the rail) is tenant-level: assurance pack, incidents, risks, and **contract ticket SLA**.

4. How SLA is calculated — two layers (do not mix them)

Layer A = the RPM contract (did we answer and restore tickets in Business Hours).

Layer B = operational SLA (is the platform — servers, backups, EPP — actually running).

Only **covered** services contribute. A No Cover pillar is dropped, not treated as 100%.

Layer A — RPM contract (SYSPRO Support & AMS Rev 5.0, August 2026)

Ticket clocks in **Business Hours** (08:00–17:00, 8 hours per day). These are **targets, not guarantees**.

Priority	Meaning	Acknowledge	Start remote	Restore
P1 Critical	System down / core process stopped, no workaround	30 minutes	1 Business Hour	8 Business Hours
P2 High	Major function impaired	30 minutes	2 Business Hours	2 Business Days
P3 Medium	Small group; workaround exists	2 Business Hours	8 Business Hours	5 Business Days
P4 Low	Minor / cosmetic	4 Business Hours	2 Business Days	By agreement

How we score it. For each clocked incident in the last **30 days**: did we meet the acknowledge clock? did we meet the restore clock?

Contract SLA % = tickets that met the clock ÷ tickets scored

Shown on **Customer SLA**. If there are no clocked tickets, we do **not** invent a percentage.

Layer B — Operational SLA (covered services only)

Equal average of scored, covered pillars. Microsoft 365 is never included.

1. SYSPRO — start at 100, then deduct. Target: 100% controls clear (AMS health, not ticket clocks).

Signal	Deduction
Collect older than 24 hours	–35 (or –50 if never collected)
Each SYSPRO job error	–15, then –5 per extra error (cap –40)
Each FinSight out-of-balance line	–10, then –2 per extra (cap –35)

2. RMM — *servers only*. Workstations never score. Target: **99.9% monthly uptime**.

- **Uptime**: if Pulseway has 30-day offline hours:
(43,200 – average offline minutes) / 43,200
Otherwise: servers online ÷ servers on the latest snapshot.
- **Critical alerts**: –12 points each (cap –40).
- **Coverage line**: servers reporting in the last 15 minutes ÷ servers.
- No classified servers → **not scored** (not 0%).

3. Cloud Backup — target **99.5% success · 24-hour RPO**.

- **Success** = OK jobs ÷ (OK + failed).
- **RPO** = last success within 24 hours (stale devices pull the score down).
- **Restore** = passed recovery tests ÷ (passed + failed), blended in at 30% when tests exist.
- Devices mapped but no job outcome yet → **70%**, not 0.

4. EPP — target **98% protected**.

- **Coverage** = managed endpoints ÷ (managed + unmanaged).
- **Currency** = product + signatures current (when the collect has those flags).
- **Open high/critical incidents**: 100% if none; –20 per open incident.

5. Microsoft 365 — Secure Score / MFA / admin posture only. **Not in the SLA average**.

5. Customer Assurance score (the large number)

Blend of live health and covered legs only. No Cover never inflates the score.

Weight	Signal
50%	Health score (from the service robots)
20%	SYSPRO collect fresh (ignored if No Cover)
15%	SYSPRO jobs clean (ignored if No Cover)
15%	RMM servers: all online and no critical alerts (omitted if no servers)

Same colour bands: Green ≥ 80 · Amber 55–79 · Red ≤ 54 .

6. What EXCO can say with confidence

1. **Cover** = we contracted / mapped it. **No Cover** = we are not pretending to measure it.
2. **Green** = covered services are meeting the live bar. **Amber** = watch. **Red** = a covered service is in breach.
3. **Contract SLA** = did we answer and restore tickets in Business Hours.
4. **Service SLA** = is the platform (servers, backups, EPP) actually running.
5. Numbers on screen are from **today's collect**, not a monthly spreadsheet.

Likely questions

"Why is this customer the same colour on the main page and inside?" — One formula now; Cover and RAG are unified.

"Why Cloud Backup No Cover if devices exist?" — Devices must be mapped to that customer code before they count.

"Why patch counts but not KB names?" — Pulseway's API only sends counts. Named KBs are collected on the server and posted into Assure.
